POLLUTION MASK

POLLUTION MASK

Pollution mask are suitable for walking and cycling in cities where poor air quality exists.

Its filtering system consists of an urban filter (Combination filter) which has both a Hepa-Type™ filter layer and a DACC™ layer. This combination in one single filter provides sub-micron filtering capability, together with DACC™ ability to filter gases and vapours. It is the best mask available for dealing with the broad spectrum of pollutants commonly found in major cities across the globe.

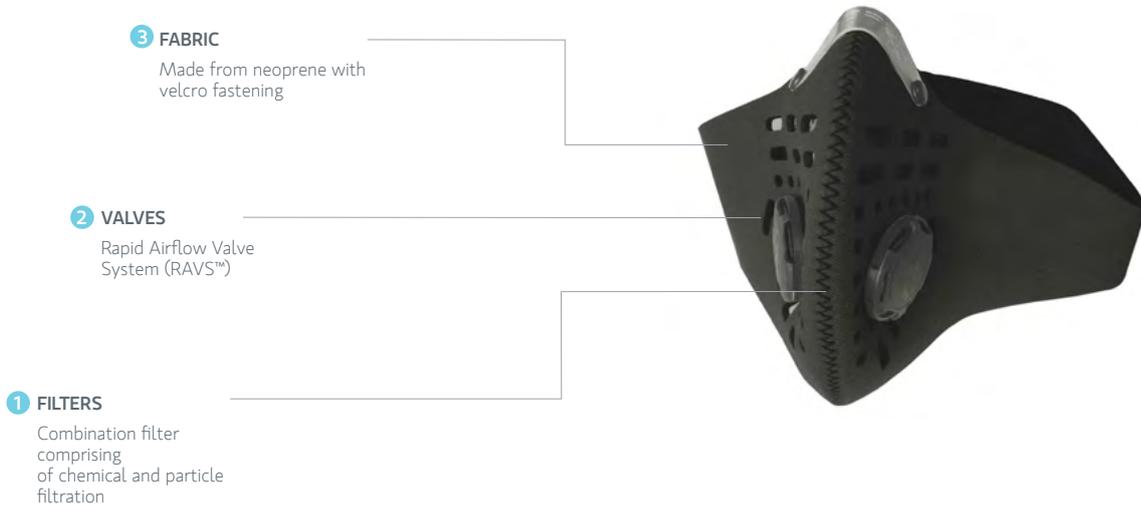

For a mask to work properly, it has to seal the area of nose and mouth from the external environment.

The inhaled air has to pass through the filter material in order to remove pollution. A nose clip is a vital component required to make an effective seal. The valves open when you exhale and close automatically when you inhale (breathing is a sinusoidal process).

Heat, water vapour and CO2 are the problems to comfort and these factors determine how long you are likely to keep the mask on in any given activity. Two valves are present on a mask to release the unwanted heat, water vapour and carbon dioxide from exhaled air.

BENEFITS

- Low breathing resistance
- Filters out: A broad spectrum of pollutants including PM2.5 and sub-micron particulates and unburnt fuel
- Fits without fuss and fully adjustable for optimal fit
- Three sizes ensures the user an effective seal
- Durable and washable

TECHNICAL CHARACTERISTICS

UTILITY	Walking and cycling in cities
FILTRATION	A broad spectrum of pollutants including PM2.5 and sub-micron particulates and unburnt fuel
VALVES	Black
SIZES	Medium / Large / X- Large
MATERIAL	Neoprene
